

AI Usage DISCLOSURE FORM

1. Team Details

Team Name: GitHappens

Project / Product Name: DebtMap: Migration Advisor

Organization / Institution (if any): MS Ramaiah Institute Of Technology

Submission Date: 08-05-2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project? Yes / No

Yes

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming: Used to conceptualize the "Migration Radar" and the methodology for converting raw technical debt into a financial "\$ Cost" metric.

Code generation or assistance: AI (via Groq/Llama 3) provides the modern code snippets and the logic for the "Neural Advice" cards that explain how to replace legacy APIs.

UI / UX design: Assisted in the development of the "Premium Motion UI," specifically the glassmorphic HUD elements and the staggered reveal animations.

Content creation: Used to generate technical justifications for migrations, translating complex deprecation logs into human-readable business impact.

Data analysis: Correlating legacy code patterns with effort estimates (Low/Medium/High) and migration cost calculations.

Testing / debugging: AI was used to generate "edge-case" legacy code samples (like nested Python 2 imports) to test the robustness of the scanner.

4. Feature Origin Classification (Please add/delete based on the number of the feature)

1. Feature Name: Neural Migration Advisor

2. Self-Generated/AI-Generated/Both: Both

3. Description (include AI tools/platform Used, prompt used , Output Summary, Modification):

This feature uses the Groq Llama 3 model to analyze detected debt.

- **AI Tool:** Groq Cloud API / Llama 3-8b.
- **Prompt used:** *"Explain why {legacy_api} is deprecated and how to move to {modern_api} in 2 sentences."*
- **Output Summary:** A concise technical justification and a 3-step actionable migration plan.
- **Modification:** We built a local "Fallback Engine" in Python that takes over if the AI is offline, ensuring the feature always works.

1. Feature Name: Deep-Scan Repository Controller

2. Self-Generated/AI-Generated/Both: Both

3. Description (include AI tools/platform Used, prompt used , Output Summary, Modification):

A high-performance Python engine that clones Git repositories and walks through source files to find patterns.

- **Modification:** While the core logic is self-generated, we used AI to refine the complex Regex patterns needed to catch obscure Python 2/3 technical debt.

1.Feature Name: One-Click Instant Fix UI

2. Self-Generated/AI-Generated/Both: Both

3. . Description (include AI tools/platform Used, prompt used , Output Summary, Modification):

A motion-heavy interface that allows users to apply code replacements in one click.

- **AI Tool:** Anthropic Claude (via Antigravity).
- **Modification:** AI was used to optimize the asynchronous JavaScript state management, ensuring that multiple "Fix" buttons could be clicked in sequence without locking the UI.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes**

No proprietary or copyrighted data misused. **I Agree**

6. Declaration & Sign-Off

Name of Team Representative: Manaswini Uppuluri

Role: Backend Developer

Signature:

A handwritten signature in black ink, appearing to read 'Manaswini', with a stylized flourish underneath.

Date: 08-05-2026
